|         |             |     |          |                 | Message . . . . . : Open of member ARMSTR was changed to SEQONLY(*NO).   |         |       |          |         |       |
|         |             |     |          |                 | Cause . . . . . : Member ARMSTR file ARMSTR in library NFREC was opened with the SEQONLY(*YES) parameter specified in the program or on the Override Database File (OVRDBF) command. However, the parameter has been changed to SEQONLY(*NO) because of condition 1 shown below: 1 - The program opened member ARMSTR for output operations only and SEQONLY(*YES) was specified with the default number of records. SEQONLY(*YES) was changed to SEQONLY(*NO) to allow the program to handle duplicate key, conversion mapping, key mapping, and select or omit errors, or both select and omit errors at the time of the output operation. 2 - The program opened the member for other than input or output operations only. 3 - The program opened a logical file member for output operations only and that member is based on more than one physical file member. 4 - The record length plus the feedback information for the member is greater than 32,767 bytes. 5 - The commitment control level of *ALL is active and the member was opened for input operations only, or the commitment control levels of either *ALL, *CS, or *CHG were specified for a distributed file that was opened for input operations only. 6 - The program opened member ARMSTR for output operations only and SEQONLY(*YES) was specified with the default number of records and duplicate key feedback or insert key feedback was requested. SEQONLY(*YES) was changed to SEQONLY(*NO) to allow duplicate key feedback or insert key feedback to be provided on a record by record basis. 7 - The program opened a query member that contains at least one subselect. Either the outermost subselect provided a correlated reference for a subquery or the outermost subselect processed a subquery with an IN, = ANY, or <> ALL subquery predicate operator, which is treated as a correlated reference. Only one record can be retrieved at a time from this type of query. 8 - The file has referential constraints, triggers, or is a distributed file. 9 - The file is a distributed file opened for DSTDTA(*CURRENT). One or more of the nodes in this file have been implemented using join logical file processing. 10 - The file, or a physical file on which the file is based, contains File Link |         |       |          |         |       |

|         |        |     |          |                 | Control DataLink fields. 11 - The file, or a physical file on which the file is based, has a column that is a ROW-BEGIN, ROW-END, TRANSACTION-START-ID, or generated expression. Recovery . . . : For condition 1 or condition 6: -- If changing parameter SEQONLY(*YES) to SEQONLY(*NO) is not acceptable, use the Override Database File (OVRDBF) command to override the parameter SEQONLY(*NO) by specifying SEQONLY(*YES N) where N indicates the number of records. Then try your request again.  |         |       |          |         |       |  |
